A mechanical retrieval system (similar to the system  
used by ASTIA) was tested on a collection of 10,000  
documents relating to organic chemistry. An IBM 705  
machine was used. The average number of key-words  
(or descriptors) was about 8 per document. A total of  
some 12,316 key-words were applied to the collection.  
After the documents were analyzed (i. e., the key-

Sequencing problems are concerned with working of  
several products over a series of machines, where the  
working times of these products differ from one  
machine to another. The problem is to find an optimal  
sequence of the products minimizing the total elapsed  
time. Under certain restrictions the problem is re-  
duced to solving the travelling salesman problem. The  
method is illustrated by a simple example. (Author)
